Ask a group of people what the top internet security software program is, and you'll get a wide variety of answers. And this is not really surprising considering the hundreds of internet security programs that exist today. And the similarity in features and tools that makes differentiating them even harder.

However, there are some differences, and you can find out more about them by checking out online reviews written by experts and customers. And you obviously don't want to download an internet security program, only to find out later that it's providing mediocre protection.

Kaspersky has time and again been voted the top internet security software program. And this is what the experts show in their tests. Virus Bulletin is one expert testing lab that has awarded Kaspersky the VB100% award for its effective removal of viruses 'in the wild'.

And these are some of the protection features you get in Kaspersky:

Antivirus

Kaspersky has the standalone antivirus program which has been rated as one of the best by Top Ten Reviews and Best Buy Antivirus. The antivirus element in the internet security program is equally effective at virus detection and removal. And it has been approved by AV-Test, which assigns it top marks for its ability to protect your PC against malware infections.

One of the main reasons Kaspersky is so effective is because it scans all incoming and outgoing communications on your computer. And its scans run in real-time and stops threats before they infiltrate your PC.

Kaspersky antivirus has three levels of protection against malware threats and they are:

 1. Checking for known threats that Kaspersky has collected in the cloud for which it has a cure
 2. Checking for unknown threats and isolating them in an environment where they can cause no harm
 3. An Active Virus Control feature which watches every process that runs on your PC and checks for any suspicious activity.

Antispyware

Kaspersky protects your PC from spying software like adware, spyware, keyloggers and browser hijackers. These threats are developed by criminals for one main purpose; and that's to steal your personal information like bank details, usernames and passwords.

Kaspersky also encrypts your Yahoo Messenger and MSN Messenger chats and totally eliminates spam. It includes an anti-phishing tool that alerts you if a domain name is fake and pretending to be genuine.

However, Kaspersky doesn't have the most effective antispyware tool. And we recommend you download another program like Webroot Spy Sweeper, the most effective spyware removal program.

But overall, Kaspersky internet security doesn't disappoint and has the best overall protection.

Summary

So we highly recommend Kaspersky internet security for your PC security. And if you use a Mac, Kaspersky has a Macintosh solution which is also one of the top rated programs in the industry.
