

The mobile phone has become an extremely useful device, which is used for different purposes. With all the different purposes, it is only obvious that it will have all mobile phones will have a operating system onto which different applications run. Basically, a mobile phone today has the same functionality and working of a computer, and therefore needs the same security that a computer would. However, not all mobile phones require the ultra expensive mobile antivirus software.

If you are using a GPRS connection:

If you are using a GPRS connection to browse websites that may not be safe, like the ones that are not owned by your mobile carrier, or if you are using the mobile internet to download software and media off the Internet, you should definitely invest in an antivirus program.

If you are using Bluetooth to transfer files:

Transferring data via any medium is the most common way to transfer virus onto media devices - be they mobile phones or computers. Therefore, if you are using Bluetooth and other devices to transfer data from one mobile to another, you should be aware that it may send some virus during the transfer, so make sure that you invest in a mobile antivirus program.

If You use a lot of applications:

Whether you are using a PDA or a JAVA phone or the recent Android, if you are using applications, there are every chances that you have a virus in your mobile after some rough use. Therefore, make sure that you install the mobile anti virus on your device if you are using applications.

Mobile phone manufacturers have now included the facility for Wi Fi connection in the latest mobiles. People are more interested in this application as they do not need to spend time in front of the computer for browsing the Internet. In a computer we use anti virus programs to

safeguard your system from the attack of viruses. What will we do for mobile phones?

Browsing the Internet through mobile will ease the entry of unwanted malwares in to your phone. You can stop this attack by getting anti virus programs suitable for phones. The popular anti virus software for mobile phones include Zebra Virus Cleaner, Kaspersky Anti-Virus, Commander Mobile Anti-Virus and F-Secure Mobile Anti-virus.

Compared to computer viruses, mobile viruses are few and about 40 of them have been reported recently. It seems that, even though they are less in number they can cause damage to the mobile.

Here we are discussing the features of the popular mobile phone anti virus program software's.

Zebra Virus Cleaner

One among the popular anti virus program for the mobile phones. Effective in destroying all the spywares, malwares, worms and other viruses including the Trojans. Provides security to all the data stored in your phone through a quick scan. The main advantage of this program is that you can set the time for the complete scan of your documents in the mobile and the scan start automatically at the time scheduled.

The Kaspersky Anti-Virus

Very popular virus detection program for the computer. They have developed a program liable to mobile using the expertise of the Kasperky Lab technologies, filters all the unwanted worms and viruses from spying the information stored in the phone.

Commander Mobile Anti-Virus

Effective anti virus program,quick scan through the phone and memory card of your phone and removes all harmful components present in your mobile. Have the ability to detect and neutralize Cabir, the most annoying virus attacking mobile phones.
